

08 MODULE DEPENDENCIES

Module Dependencies & Team Coordination

How TRINETRA modules connect and what each owner must provide to the rest of the team.

Team handoff matrix

Owner	Module	Needs	Must deliver
Abhinav	Dashboard, auth, frontend, backend, database	Approved flows; GIS and AI payloads	Working UI, APIs, schema, implementation status
Rahul	Map, GIS, real-time monitoring	Incident/resource schema and source data	Layer inventory, formats, sample payloads, map behavior
Prinshu	AI/ML, testing, security, deployment	Validated use case and available data	Model contract, evaluation, test/security plan, deployment
Khushi	Problem research and validation	Research questions and scope	Verified findings, evidence, source links
Raghav	Documentation and presentation	Approved product and technical narrative	SIH documentation, slide drafts, review feedback
Ayush	Product planning and coordination	All team handoffs	Scope, requirements, flows, PPT content, demo script

AI / Risk Assessment supports authority decisions

Concrete coordination briefs

To Abhinav — Dashboard must contain: active disasters, severity, affected locations, alerts, risk level, emergency resources, recent reports, and map preview.

To Rahul — Map layers: disaster locations, affected areas, safe zones, hospitals, relief centers, emergency resources, and citizen incident locations.

To Prinshu — Model contract: available inputs → AI/ML/rules → risk score, risk level, classification, and recommendation. Inputs must match data the team can actually obtain.
