

03 USER FLOWS

User Flows

Four practical flows showing how citizens, authorities, and responders move through TRINETRA.

Flow 1 — Citizen

Example alert journey

Flood Alert — High Risk → Open Map → See Affected Area → Find Nearest Safe Zone → Find Emergency Resources

Flow 2 — Authority

01	Authority login
	↓
02	Open authority dashboard
	↓
03	Review active disasters
	↓
04	Open map and affected areas
	↓
05	Review citizen reports
	↓
06	Analyze risk information
	↓
07	Create and publish alert
	↓
08	Citizens receive the alert

The two-way model

Citizen → Authority: structured local reports.
Authority → Citizen: verified alerts, map context, safe zones, and resources.

Flow 3 — Emergency response

Flow 4 — Incident reporting

Flow design requirements

- Show loading, empty, validation, permission, offline, and service-error states.
- Clearly distinguish citizen-reported, authority-verified, and AI-derived information.
- Keep the MVP route short, coherent, and reliable enough for a live demonstration.
