

04 MVP VS ADVANCED

MVP vs Advanced Features

A scope firewall that keeps TRINETRA's core system ahead of optional AI ambitions.

MVP scope — committed first

The MVP must be fully functional as one end-to-end system. It should favor reliability and integration over breadth.

#	MVP capability
1	User authentication
2	Disaster dashboard
3	Disaster map
4	Disaster locations
5	Affected areas
6	Safe zones
7	Emergency resources
8	Disaster alerts
9	Citizen incident reporting
10	Authority dashboard
11	Basic risk assessment

Advanced scope — explicitly uncommitted

#	Advanced capability
1	AI disaster prediction
2	AI incident classification
3	Image-based damage detection
4	AI recommendations
5	Predictive evacuation
6	Satellite imagery analysis
7	Crowd-density analysis
8	AI chatbot
9	Advanced forecasting
10	Automated alert generation

Delivery sequence

- | | |
|----|------------------------------------|
| 01 | MVP scope is frozen |
| | ↓ |
| 02 | Make the core flow work |
| | ↓ |
| 03 | Test each feature |
| | ↓ |
| 04 | Integrate modules |
| | ↓ |
| 05 | Rehearse the demo |
| | ↓ |
| 06 | Only then add advanced AI/features |

Scope firewall

No advanced feature enters the committed MVP without an owner, feasible data, testable acceptance criteria, dependency review, demo value, and an explicit trade-off against existing scope.
